ENERGY PRODUCTION

Problem-Risk-Need-Analysis

No critical chain reaction

No risk of explosion

No meltdown risk

No plutonium or uranium 235

Non-weapons-grade material

Secure energy supply for long period

No uncontrolled - transuranic nuclear waste > 100,000 years

+ USP - No TI-208 production

Zero CO2 emission

Non-volatile energy

No large powerlines

High power density

High profitability with global impact

Low land-use requirements for systems

Affordable high temperature heat > hydrogen or electricity

+ Proof of concept

Solution for:

AI
Data Centers
Remote Areas
Critical Infrastructure

SOLUTION: Compact, Modular, Safe, Profitable

Dual Income
modular & scalable

NON-Criticality

WHAT EMERALD HORIZON EARNS

+16% Equity IRR

≈ \$0.16m net profit / year
(per 1 DUALstore Plus client)

Baseline: 7× CALstore + 3× E-store

CAPEX: \$6.6m

KEY ASSUMPTIONS (FOR PROFESSIONAL BACK-CALC)

ADES: 10 MWe net (=80 GWh/yr @ ~95% uptime); cost base = 1.7c/kWh (CAPEX+OPEX); FX 1 EUR = 0.85 USD. Financing: 85/15 debt/equity @ 5%; tax 26%. DUALstore baseline as noted. No customer CAPEX. Excludes indirect income (e.g., carbon credits). Illustrative only; not audited. We already executed EaaS end-to-end (proof of operability).

DUALstore Plus
„stable income”

ADES - ACCELERATOR DRIVEN ENERGY SOURCE

emerald horizon 

The scalable and risk-optimized solution for CO₂-free energy

ON/OFF switch

- ADES has a **passive-safe ON/OFF** control unit.

AI-powered optimization

- ADES **leverages AI** to **adjust its power output** based on the installation location.
- ADES thereby ensures **optimal performance** in **diverse environments**.

Significantly reduced nuclear waste

- ~80% of thorium is **converted** into energy. Even the remainder contains raw materials that **can be reused**. No final repository for nuclear waste is hence necessary.
- ADES **produces ~0% transuranic waste** of plutonium, neptunium, americium and curium, ... known as nuclear waste.
- It only produces radioactive fission products with short half-lives.

No critical chain reaction

- ADES runs **subcritically**.
- When the injector impulses the thorium, it triggers a reaction - **but no critical chain reaction** - making ADES much safer than conventional nuclear power plants.
- Zero explosion risk since there is NO overpressure and NO water / steam.
- No thallium-208 production

Minimum maintenance

- The final ADES module **does not require continuous maintenance**.
- A **Safety Security Environment Software** will ensure safe control (separate energy from NES- see patent)
- Expected - No refueling required for 20 years
- Low operating expenses (OPEX)

READY FOR
ORDER
EST. 2029

1 x ADES module: 25 MW(th) = 10 MW(el) for 20 years

.. can be combined to achieve higher energy output

.. can be delivered worldwide
and installed as plug-and-play

Output:
High temperature
heat

To generate:
Heat
Electricity
Hydrogen

ADES – PROTOTYPE SETUP -> SERIAL PRODUCT TRL 9

TIER-1 execution partner

Co-Development to achieve TRL 9

Manufacturing

Supply Chain

Reality check:
All prototype components already exist

Censored for security reasons

Hybrid storage system combining high-temperature heat (TESS) and electricity storage (BESS).

- CALstore: 5 MWh(th) molten-salt thermal storage; efficiency >98%; unlimited cycling (as stated)
- Estore: ~5 MWh(el)(LFP), ≥ 8,000 cycles; system efficiency ~94%; IP55 / C4 (as stated)
- MCU orchestrates thermal & electrical flows (AI control unit)
- PLUS function: Selling surplus electricity back to the grid, generating additional revenue
- Deployable worldwide starting in 2026

READY FOR
ORDER EST.
Q3 2026

Designed for 20-year EaaS contracts and global deployment.

EaaS Proof: Emerald Horizon did already a full cycle of acquisition → 20year contract → billing → metering → maintenance → insurance → bank financing, Raiffeisen

Government-funded,
with ongoing
oversight & periodic
audits

CALstore is a 5 MWh molten salt heat storage system that balances energy oversupply with demand. It supports ADES, is part of DUALstore PLUS, and can also operate as a stand-alone system.

- The system maintains stability in both **low and high ambient temperature** conditions.
- Salt has a high energy density, CALstore **stores large amounts of energy (5 MWh)** which can be released when needed.
- The system is **entirely water-free**, eliminating the risk of vapor pressure or detonation gas reactions.
- **Abundant, cheap, and well available salts** like potassium nitrate and sodium nitrate are used. These salts have the capacity to store substantial amounts of energy in a minimal space.
- **The configuration is adaptable** (salt mixture, storage capacity and temperature range) depending on the specific energy input and output requirements. The **scalability of the system** ensures mass-production.
- The system is not deteriorating; **the storage capacity remains constant** over the life-cycle and requires only minimal maintenance.

2029 + Green Bonds

ADES TRL 9 / orders
+ project finance ramp

- Real paid-in valuation reference (€791.2m post-money) with a peer set that supports billion-scale outcomes (SMR, OKLO, NNE, X-energy: \$1–20bn valuation range).
- Scenario-based DCF indicates multi-billion intrinsic value as the company reaches defined technical and commercial milestones (4 valuation scenarios at a 25% discount rate: \$4.4 -25.2bn range).
- Dual Income downside protection: DUALstore PLUS enables bankable 20-year EaaS cashflows starting in 2026.
- Milestone de-risking: readiness scorecards translate technical, regulatory, and commercial progress into valuation step-ups.
- Capital-efficient execution: lean core teams and Tier-1 partner delivery, supported by a blended/non-dilutive funding stack → lower equity dilution per delivered output.
- Proven monetization “prototype”: contracting/EaaS activities already generated revenue and validated long-term contracting and bankability.
- Strong alignment and scale-up credibility: founders and early investors remain materially invested.
- VDL confirmation letter (post extensive due diligence) underpins industrialization and supply chain readiness.

Readiness scorecards (current)

Company readiness (non-technical)

1935 / 2700

72%

- Execution confidence + governance package
- Data room & diligence package
- Regulatory + bankability checks (lender process - Raiffeisen)

DUALstore PLUS readiness (Estore and CALstore)

1800 / 2700

67%

12M outlook

- Estore (BESS) + CALstore (TES) + MCU (AI control)
- Ready for global deployment from 2026
- Bankable 20-year EaaS structure

ADES readiness (deep-tech)

1590 / 2700

59%

12M outlook

- 3 workstreams: structures/heat loop + accelerator/targets + nuclear release loop
- Prototype components exist; TRL-gated plan
- Use of funds closes DELTA to TRL 9

Note: Readiness scores and triggers are indicative and based on internal underwriting scorecards; offering details are subject to formal documentation. For further details see Appendix (Page 13-15).

Timeline and near-term milestone triggers

Each scorecard is broken down into 27 checks. Completing key milestones triggers step-ups in the valuation matrix (e.g., higher U.S. tranche valuation and next rounds).

Near-term trigger examples

Regulatory	Pillsbury memo: classification + licensing roadmap (U.S.); EU pathway redundancy
Commercial	20-year EaaS contracts signed; deliveries start (Estore Q3 2026; CALstore 2027)
Technical	Integrated prototype commissioning; safety interlocks + reliability demo closing TRL DELTA
Financing	Slovakia incentives application → €75-100m equity relief; project finance pack
Execution	Tier-1 industrialization (e.g., VDL) plus QA & delivery workplan

What investors underwrite

APPENDIX – METRICS – CREDIBILITY

COMPANY READINESS – NON-TECHNICAL SCORECARD

Physics-Based
Validation

$$E_{\text{fission, total}}(T) = \int_0^T \left(3.204 \times 10^{-11} \right) \sigma_{f, \text{U233}}^{\text{therm}} \phi_{\text{therm}} N_{\text{U233}}(t) dt$$
$$= \left(3.204 \times 10^{-11} \right) \sigma_{f, \text{U233}}^{\text{therm}} \phi_{\text{therm}} \frac{\lambda_{\text{Pa233}} \lambda_{\text{Th233}} \sigma_{c, \text{Th232}}^{\text{epi}} \phi_{\text{epi}} N_{\text{Th232}}(0)}{(\lambda_{\text{Pa233}} - \lambda_{\text{Th233}}) (\lambda_{\text{Th233}} - \sigma_{c, \text{Th232}}^{\text{epi}} \phi_{\text{epi}}) (\sigma_{f, \text{U233}}^{\text{therm}} \phi_{\text{therm}} - \lambda_{\text{Pa233}})}$$
$$\times \left[\frac{1 - e^{-\sigma_{c, \text{Th232}}^{\text{epi}} \phi_{\text{epi}} T}}{\sigma_{c, \text{Th232}}^{\text{epi}} \phi_{\text{epi}}} - \frac{1 - e^{-\lambda_{\text{Th233}} T}}{\lambda_{\text{Th233}}} - \frac{1 - e^{-\lambda_{\text{Pa233}} T}}{\lambda_{\text{Pa233}}} + \frac{1 - e^{-\sigma_{f, \text{U233}}^{\text{therm}} \phi_{\text{therm}} T}}{\sigma_{f, \text{U233}}^{\text{therm}} \phi_{\text{therm}}} \right]$$

$$\phi_{\text{total}} = \frac{S_{\text{ext}}}{V_{\text{core}}} \frac{1}{1 - k_{\text{eff}}}, \quad \phi_{\text{therm}} = f_{\text{therm}} \phi_{\text{total}}, \quad \phi_{\text{epi}} = f_{\text{epi}} \phi_{\text{total}}$$

System Parameters (typical magnitudes)	
Symbol	Description
V_{core}	Active reaction volume
S_{ext}	External neutron source strength (e.g. Li(p,n) or D(d,n))
k_{eff}	Effective neutron multiplication factor (subcritical)
T	Operation time horizon
f_{therm}	Fraction of the total neutron flux in the thermal spectrum
f_{epi}	Fraction of the total neutron flux in the epithermal spectrum ($f_{\text{therm}} + f_{\text{epi}} = 1$)
$\sigma_{c, \text{Th232}}^{\text{epi}}$	Microscopic capture cross section of Th-232 for epithermal neutrons (Th-232 $\rightarrow$ Th-233)
$\sigma_{f, \text{U233}}^{\text{therm}}$	Microscopic fission cross section of U-233 for thermal neutrons
$\sigma_{c, \text{U233}}^{\text{therm}}$	Microscopic capture (non-fission) cross section of U-233 for thermal neutrons
λ_{Th233}	Decay constant of Th-233 $\rightarrow$ Pa-233 (half-life = 22.3 min)
λ_{Pa233}	Decay constant of Pa-233 $\rightarrow$ U-233 (half-life = 26.97 days)
$N_{\text{Th232}}(0)$	Initial inventory of Th-232 atoms (= 10 kg)
$N_{\text{Th233}}(t)$	Transient intermediate isotope concentration
$N_{\text{Pa233}}(t)$	Protactinium-233 atoms produced and decaying to U-233
$N_{\text{U233}}(t)$	Fissile inventory of U-233 atoms available for fission
E_{fission}	Average energy released per fission

Stable flux realization will be achieved using accelerator-based neutron sources (two complementary solutions will ultimately be available - risk reduction).
